AB - J05320592 The tape is prepd. by forming a self-adhesive layer on both sides of a base sheet. A separator treated with a release agent consisting of a polymer which has fluorine-contg. side chain in siloxane structure is attached temporarily to the self-adhesive layer. One of the self-adhesive layers consists of a silicone-based self-adhesive, and the other consists of an acrylic resin-based self-adhesive.

- The base sheet includes plastic sheet, plastic foam sheet, nonwoven fabric, paper, laminate thereof, metal foil, etc.

- The silicone-based self-adhesive is amide from dimethyl siloxane and dimethyl siloxane in which a part of methyl gps are substd. with phenyl gps.

- USE/ADVANTAGE - For bonding of silicone rubber, metal, etc. The double-coated self-adhesive tape has consistent bond strength, shows quick development of bonding power, shows good release of separator, and does not cause staining of substrate due to squeezing out of adhesive.
